Currently, qualitative and quantitative approaches are being used to assess the performance of regional executive authorities. The assessments obtained on their basis, as a rule, include a subjective component. This paper proposes a method that allows obtaining weighting coefficients of evaluation indicators on a formal basis without involving experts. It includes four main stages of calculations: preparation of initial data, including a set of evaluation indicators; formation of a structural matrix of achievements; assessment of the complexity of indicators and achievement structures; and performance assessment. The peculiarity of the method is that it allows one to gain an idea of the relative complexity of solving problems and achieving the goals of socio-economic development.
